Dairy-Herd-Improvement-Association Letter

ARS-52-22
(Vol. 31, No. 11)

November 1955

A CHANGE IN THE DHIA NUMBERING PLAN

In 1935 a uniform eartag numbering plan was adopted for identifying cows on test in Dairy-Herd-Improvement Associations. Every cow on DHIA test identified with an eartag gets her own special eartag number, with no possibility of the number being duplicated anywhere in the United States. Through the years this eartag numbering plan has proved satisfactory. The plan is now being extended into a nationwide uniform eartag numbering plan to include all dairy and beef animals. In the future, dairy and beef animals need not be given another tag each time they are tested for disease or placed on DHIA test. One eartag, carrying a uniform eartag number, will serve for all identification purposes.

The numbering system, a combination of letters and numbers, can provide identification for more than 8 billion cattle in the United States and territories without a single duplication.

There is an eartag-number series for each State. A complete series of eartag numbers for one State can run, for example, from 35AAA0001 through 35ZZZ9999. (The number "35" is the State code for Wisconsin.) A block of 175,760,000 different numbers is provided for each State, sufficient for all the different agricultural programs concerned with dairy herd improvement, artificial breeding, and disease control and eradication.

Special blocks of eartag numbers are being set aside for use in DHIA and ABA programs. In each State the "W" series will be used by DHIA's, 35WAA0001 through 35WZZ9999. Similarly in each State the "X" series will be used by the artificial breeding groups, 35XAA0001 through 35XZZ9999.

The new plan has several advantages: (1) Uniform size numbers - every number will contain two digits (State code) three letters and four digits. Incorrect numbers because of added or omitted digits are readily detected; (2) No duplicate numbers, and (3) only one eartag number per animal.

DHIA's and ABA's will continue to obtain their eartags through the offices of the State Extension Dairymen. It is necessary that all orders be "booked" to prevent issuing duplicate eartag numbers. Officials and workers in disease eradication and control programs can obtain information on the new eartag numbering plan from the office of the State veterinarian.

DHIA PROVED-SIRE RECORDS TABULATED IN OCTOBER 1955

Following is a list of 341 sires whose records were tabulated or retabulated by the Dairy Husbandry Research Branch in October 1955. Production records used in proving DHIA sires consist of 305-day lactation records standardized to a mature equivalent twice-a-day milking basis.

An asterisk at the end of a sire's registration number indicates a retabulated record. The asterisk may be followed by any number from 1 through 15 (i. e., *12) to indicate in which of the 15 printed lists his previous record appeared. Or the asterisk may be followed by the month and year (i. e., *May 51) of the DHIA letter in which his previous record appeared. Two asterisks following the sire's registration number, or following reference to a previous listing, indicate that the proved-sire tabulation or retabulation was requested by one of the States.

In case records from more than one herd were used, the reference is to the herd from which production records for the largest number of the sire's youngest daughters were reported. If the sire has been used in an artificial-breeding association, the name of the association is given.

Proved-sire records consisting of fewer than 10 comparisons are indicated as "preliminary proofs" because these records may be significantly changed when additional comparisons become available and are included in the proved-sire records.

Proved-sire records consisting of fewer than 25 comparisons with daughters resulting from artificial breeding are indicated as "preliminary AB proofs" because these records may be significantly changed when additional comparisons become available and are included in the proved-sire record.

To make the most intelligent selection of a sire, the dairyman should use these proved-sire records to single out the most promising sire and then make every effort to supplement these data with additional information gathered from the herds in which the dams and daughters made their records. Particular attention should be given to the feeding practices and environmental conditions under which the records were made, in order to be assured that the records of the daughters were not made under more favorable conditions than those of the dams or vice versa. It is especially important to determine that there has been no selection of daughters in making the comparison.
